

HIDDEN HUNGER AND THE BENEFIT OF BROAD-SPECTRUM FOLIAR

'Farmer to Farmer' Series | Volume 6 featuring Grant Borgward

by Carol Phillips, Executive Consultant Communications and Media

The video that is being presented today highlights a particularly important issue for farmers and growers – no matter where they farm or grow around the world or what their particular crop type is – because it directly involves the soil in which the crops are growing.

The term 'hidden hunger' suggests that it is something that is not seen. That it is something that could not be readily resolved unless we could actually see it. That is, up until now.

Hidden hunger is where yield is lost because of an unseen nutrient deficiency.

Grant explores this issue against the backdrop of basic agronomic philosophy and provides a very straightforward and easy to understand answer. To get maximum yield out of every hectare (which is every 10,000 sq. metres) the right nutrients have to be put in the tank.
